## Discussion 1:

在 init 裡指定 GFS\_2000 和 AFS\_16G, 這兩個變數在前面就有設定好他的值。

```
## Constructor
# @param [in] address MPU-9250 I2C slave address default:0x68
def __init__(self, address=SLAVE_ADDRESS):
    self.address = address
    self.configMPU9250(GFS_2000, AFS_16G)
    self.configAK8963(AK8963_MODE_C8HZ, AK8963_BIT_16)
```

並且傳入 configMPU9250,在那裏面會去 call bus.write\_byte\_data,他是去指定特定 address 的 3、4 號 bit 的值 •

```
# gyro full scale select
bus.write_byte_data(self.address, GYRO_CONFIG, gfs << 3)
# accel full scale select
bus.write_byte_data(self.address, ACCEL_CONFIG, afs << 3)
# a purpose</pre>
```

## Discussion 2:
